Project 2: Creative Brief
01 November 2016

Credit Card Picker: version Android

Project 2 will be an Android version of Project 1. This version aims to include at least some of the extension features that are going to be part of my Grad Project extension for Project 1. My goal is to see how easy or difficult it is to replicate an app between the two devices.

Some of the slight differences for this app are that I will be using a toggle for some of the options rather than a switch, because my app does not enable any in-app behavior. Those categories are more used as filters, which I believe a toggle fits better. I will use the same information from my iPhone app, both for consistency and for ease (because strings do not equal development). I have the following UI implementations in mind:

- Credit score (spinner of optional ranges)
- Number of previous credit cards (important to indicate starter cards)
- 5/24 (toggle. Need to see if I can control enabled/disabled behavior)
- No annual fee (toggle)
- Balance transfer / promo APR (toggle)
- Rewards categories (checkboxes if possible. May allow Android app to present more options.)

We have not covered Java classes or multi-views yet, so there is chance I will have to figure out how to make the information persist in only the .xml files instead. Additionally, I will also have to figure out how to allow for page scrolling in Android.
